

Metrics Governance Engine

CERTIFIED OPERATIONAL INTELLIGENCE INFRASTRUCTURE

THE PROBLEM

Restaurants operate on an assumption that the data entering their systems of record is correct. **It often is not.** Point-of-sale, payroll, inventory, delivery aggregators, payment processors, supplier systems, and accounting platforms all produce data independently — and each maintains its own version of operational truth.

Once that data lands in a system of record, it is treated as authoritative — despite no independent validation, reconciliation, governance, or certification. As AI becomes embedded throughout operations, the risk compounds: flawed data in, flawed forecasts, insights, and decisions out.

Seven systems. Seven versions of the truth.

Every source reports independently — and nothing checks their work before it becomes the official record.

**AI does not determine whether data is correct.
It simply consumes the data it is given.**

The industry has invested in collecting data and analyzing data — and almost nothing in certifying it.

THE MISSING LAYER

Every system of record assumes the data it stores is true. The MGE makes that assumption true — certifying every metric **before** it becomes the official record, and before any AI consumes it.

WHAT THE MGE CERTIFIES

VALIDATE

Every transaction, shift, invoice, and deposit confirmed accurate and complete at the source.

RECONCILE

Records matched across systems — sales to deposits, labor to payroll, purchases to invoices.

GOVERN

Consistent definitions, rules, and controls so every metric means the same thing everywhere.

CERTIFY

Data stamped audit-ready before reporting, accounting, or AI ever touches it.

WHERE IT FITS: A HEADLESS BOLT-ON TO YOUR SYSTEM OF RECORD

License the layer your platform is missing.

OEM and bolt-on licensing for SoR platforms — request a technical walkthrough.
